Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
 a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the e edges shall not include any overhang distances.
 B=Horizontal dimension of building measured normal to wind direction, in ft (m).
 h=Mean roof height, in ft (m).
 θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
 a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
 B=Horizontal dimension of building measured normal to wind direction, in ft(m).
 h=Mean roof height, in ft(m).
 θ=Angle of roof from horizontal, in degrees

 a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
 B=Horizontal dimension of building measured normal to wind direction, in ft(m).
 h=Mean roof height, in ft(m).
 θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, inft(m).
h=Mean roof height, inft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, inft(m).
h=Mean roof height, inft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
 a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
 B = Horizontal dimension of building measured normal to wind direction, in ft(m).
 h = Mean roof height, in ft(m).
 θ = Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)

a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
 B=Horizontal dimension of building measured normal to wind direction, in ft(m).
 h=Mean roof height, in ft(m).
 Θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
 a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
 B=Horizontal dimension of building measured normal to wind direction, in ft (m).
 h=Mean roof height, in ft (m).
 θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, inft(m).
h=Mean roof height, inft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Notation (ACSE 7-22)
a = 0.4h, never less 4% of least horizontal dimension or 3ft (0.9m). The horizontal dimensions used to compute the edges shall not include any overhang distances.
B=Horizontal dimension of building measured normal to wind direction, in ft(m).
h=Mean roof height, in ft(m).
θ=Angle of roof from horizontal, in degrees

Bonding and Grounding

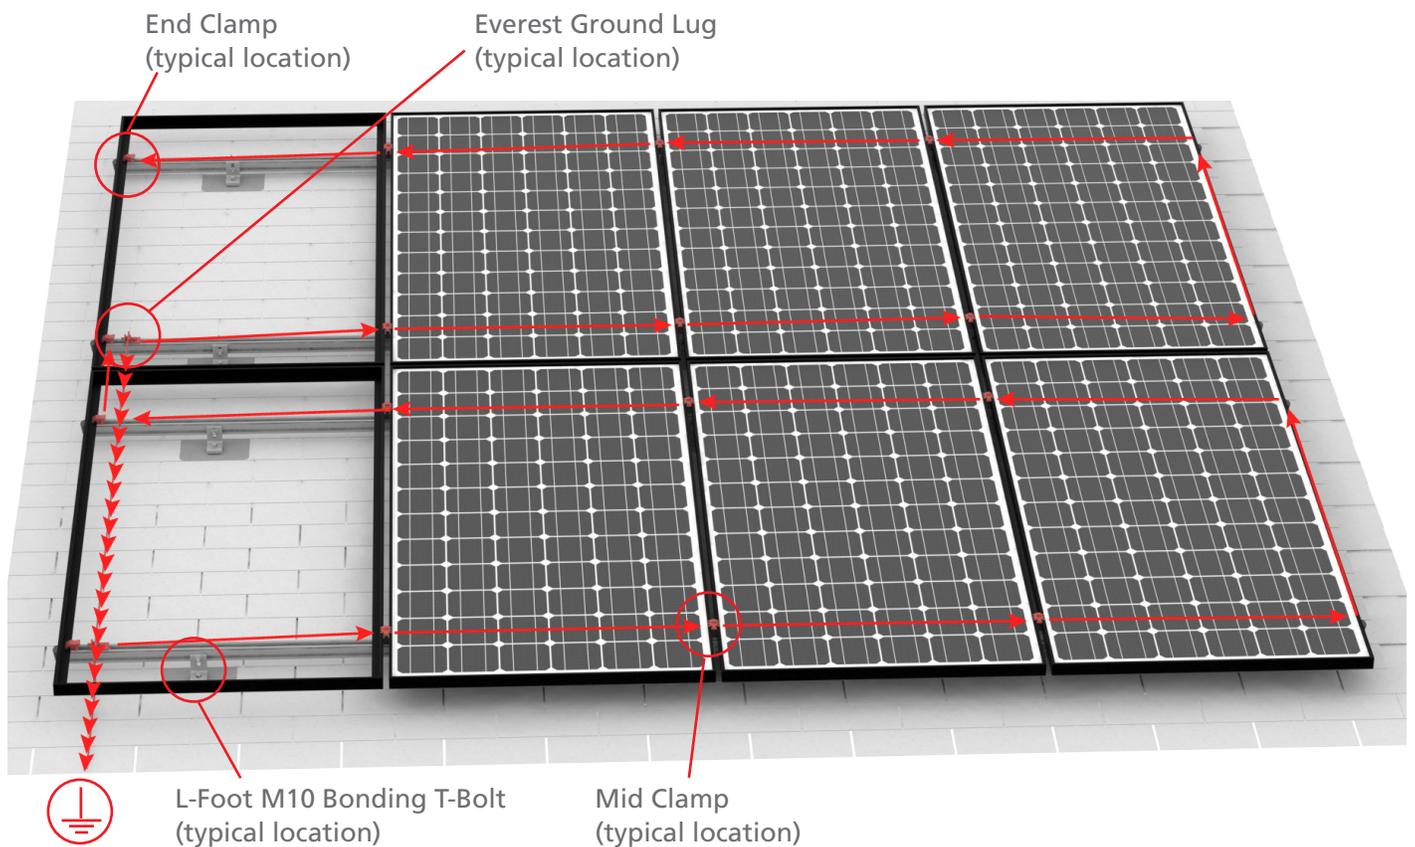

Appropriate means of bonding and grounding are required by regulation. The information provided in this manual shall always be verified with local and national building codes.

Everest Solar Systems has obtained a UL 2703 system listing from Underwriter's Laboratories (UL).

A sample bonding path diagram is shown in Figure 1 below. Your specific installation may vary, based upon site conditions and your AHJ's requirements.

Each electrical connection has been evaluated to a maximum fuse rating of 30A. At least one ground lug per row of modules must be used to ground all strings within each sub-array, although additional may be used for redundancy. When installed per these installation instructions, all connections meet the requirements of NEC 690.43.

This racking system may be used to ground and/or mount a PV module complying with UL 1703 only when the specific module has been evaluated for grounding and/or mounting in compliance with the included instructions.

Fire Rating

The CrossRail 48-X/48-XL System has undergone fire performance testing in accordance with UL 2703, Fire Performance. A System Class A fire rating is achieved when using CrossRail 48-X/48-XL under the following conditions:

- ▶ Roof slope of 2/12" rise per linear foot or greater
- ▶ Used in combination with a UL 1703 Listed module with a fire performance rating of Type 1, Type 2, or Type 3. Consult the module manufacturer for specific fire performance rating information.
- ▶ CrossRail may be mounted using any stand-off height to maintain the Class A fire rating. Always consult the module manufacturer's installation instructions to ensure your installation is in compliance with their UL 1703 Listing.
- ▶ The results of the racking system do not improve a roof covering Class rating.

All documentation can be found on UL's Online Database as well as Everest Solar Systems' website.

Assembly

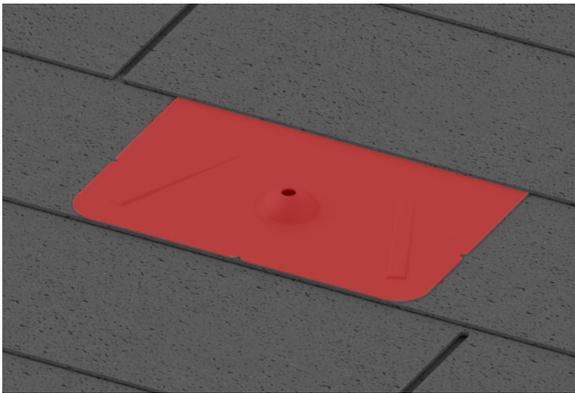

1 PREPARE ROOF

Locate the rafters and snap horizontal and vertical lines to mark the installation position for each EverFlash flashing. Drill a pilot hole (1/4" diameter) for the lag bolt. Backfill with appropriate sealant. Always consult a professional roofer to ensure integrity is maintained.

Materials required: Tape measure, string line, drill

2 INSERT EVERFLASH FLASHING

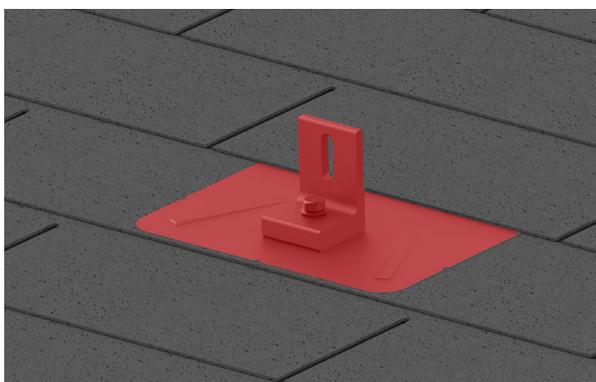

Insert the flashing so the top part is under the next row of shingles and pushed far enough up slope to prevent water infiltration through vertical joint in shingles. The leading edge of flashing must butt against upper row of nails to prevent turning when torqued.

Important: The flashing must not overhang the butt end of the shingle.

Materials required: EverFlash flashing

3 ATTACH EVERFLASH L-FOOT

Line up pilot hole with the EverFlash flashing hole.

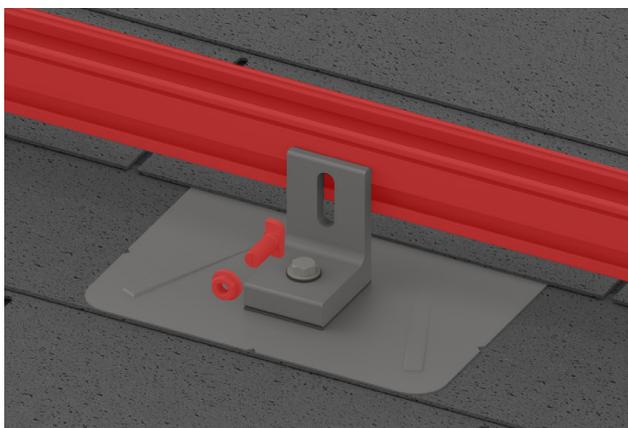

EverFlash XP Kit: Using the guide marks in the flashing, line up the pilot hole with the hole on the dome of the EverFlash XP flashing. Place L-Foot over dome on flashing and drill lag bolt with sealing washer into the pilot hole.

EverFlash eComp Kit: Insert the lag bolt through the EPDM bonded washer, the L-Foot, the gasketed hole in the flashing and into the rafter.

Torque: The range is between 8.3 - 11.6 ft-lb depending on the type of wood and time of year. The visual indicator for proper torque is when the EPDM on the underside of the bonded washer begins to push out the sides as the washer compresses. If using an impact wrench to install the fasteners, be careful not to over torque the fastener. You may need to stop and use a ratchet to finish the install.

Materials required: Lag bolt, EverFlash L-Foot and hardware, torque wrench with 13 mm socket.

4 INSTALL CROSSRAIL

Insert the T-Bolt through the L-foot slot and into the side channel of CrossRail. Turn the T-Bolt clockwise ensuring that the mark at the end of the shaft is vertical, indicating proper alignment. Tighten to 25.8 ft-lb (35 Nm). Make sure that the top of the CrossRail is located above the top of the L-Foot. Double check that the alignment marking on the end of the T-Bolt shaft is vertical, to ensure it is properly engaged.

Due to thermal expansion, we recommend placing a gap of 1.25-2.00" (3-5 cm) every 65 ft (20 m) between rails. Maximum allowable spacing between thermal expansion gaps shall not exceed 80 ft (24.4 m).

Note: Rail cantilevers may not exceed 1/3 of the maximum allowable span. Refer to the engineering letters on Everest's website (www.everest-solarsystems.com) for more detail on maximum spans and cantilevers.

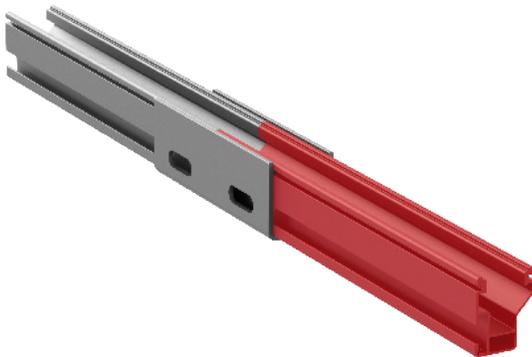

Materials required: CrossRail, M10 T-Bolt (use bonding T-Bolt with dark rail), Serrated Hex Nut

5 RAIL CONNECTOR INSTALLATION ALIGN RAILS

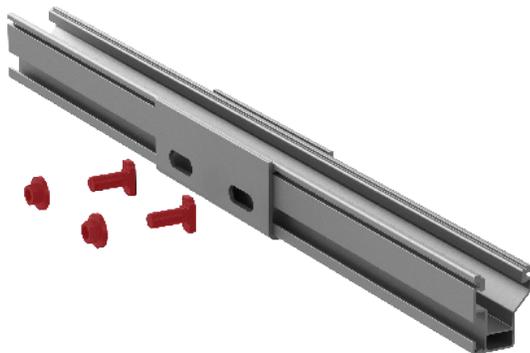

Align the two rail ends next to each other.

6 SLIDE RAIL CONNECTOR

Slide the rail connector from below the rails, centering the connector between the two rail ends. Ensure the rail connector does not interfere with an L-Foot or roof attachment.

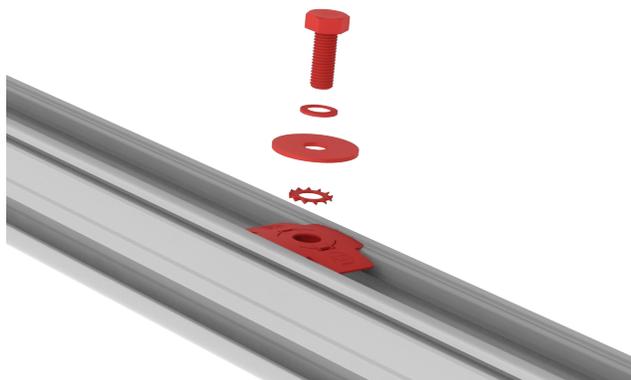

7 CONNECT RAILS

Attach the rail connector using two T-Bolts (use bonding T-Bolts with dark rail) and Serrated Hex Nuts per side (4 total). Ensure that the slot on the bottom of the T-Bolt is vertical, indicating that the T-Bolt head is properly engaged in the rail channel.

Torque: Serrated Hex Nuts to 25.8 ft-lb (35 Nm).

8 OPTIONAL: ATTACH MICRO INVERTERS

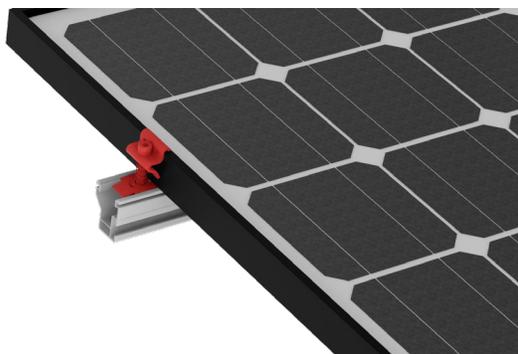

Using the Micro Inverter Mounting Kit Hardware from Everest Solar Systems, attach your chosen device to the top channel of CrossRail. Torque M8 13 mm hex bolt to 10.3 ft-lb (14 Nm).

Note: The inverter hardware kit is not intended to replace the micro inverter ground and has only been evaluated to attach to the rail.

Tightening torque: 10.3 ft-lb (14 Nm)

Materials required: Micro Inverter Mounting Kit includes: M8 13 mm hex head bolt, M8 lock washer, M8 flat washer, MK3.

9 ATTACH END CLAMPS

A OPTION 1

Insert the MK3 slot nut of the preassembled end clamps into the top channel on CrossRail. While slightly lifting the plastic tabs, rotate 90 degrees clockwise to engage the MK3 into the channel.

Attach the end clamps to the module at the specified locations per the PV module manufacturer's installation instructions. Torque the M8 bolt to 10.3 ft-lb. Ensure the clamp sits flush against the frame of the PV module.

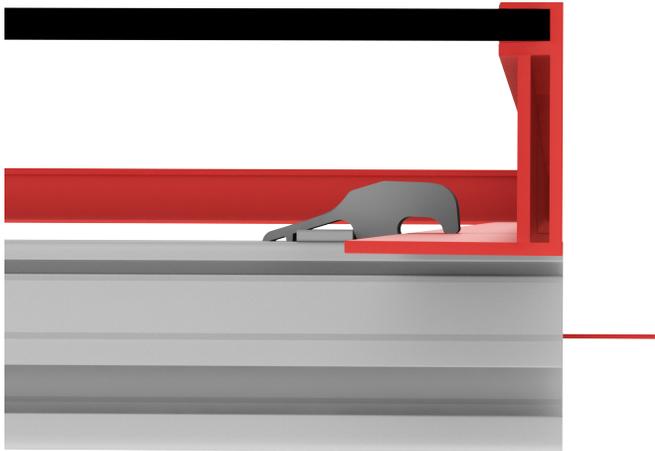

Never mount end clamps directly over a rail connector or at the end of the rail. Ensure a minimum gap of 1" (20mm) exists from the end of the rail to the clamp.

Tightening torque: 10.3 ft-lb (14 Nm).

Important: Verify module manufacturer's mounting requirements and specifications to ensure your selected clamping method is acceptable.

Note: For certain jurisdictions, if clamp tension is released, the clamps need to be relocated on panel to ensure bonding path.

Materials required: End Clamp

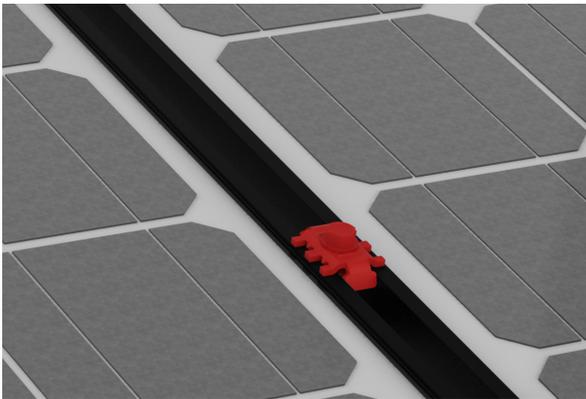

B OPTION 2

Push the zip tie up into the leash channel located at the bottom of the Yeti Clamp. With the leash installed, slide the clamp into the rail channel with the bolt facing outward. Leave enough room for the module to be placed. Place the module flush to the end of the rail. Pull the leash toward you so that the clamp slides over the module frame. Using a torque wrench or standard drill with a 13 mm socket, pull the clamp towards you and tighten the bolt.

Torque: 12 ft-lbs

10 ATTACH MID CLAMPS

Insert the MK3 slot nut of the preassembled mid clamps into the top channel on CrossRail. While slightly lifting the plastic tabs, rotate 90 degrees clockwise to engage the MK3 into the channel.

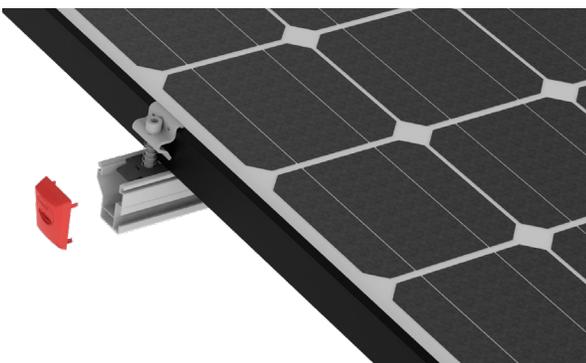

Attach the mid clamps to the module at the specified locations per the PV module manufacturer's installation instructions. Torque the M8 bolt to 12 ft-lbs. Ensure the modules are flush against the clamp, and torque.

Important: Verify module manufacturer's recommended clamping specifications are met.

Note: For certain jurisdictions, if clamp tension is released, the clamps need to be relocated on panel to ensure bonding path.

Materials required: Mid Clamp

11 OPTIONAL: ATTACH END CAPS

Push the pins of the appropriate end cap into end of the rail.

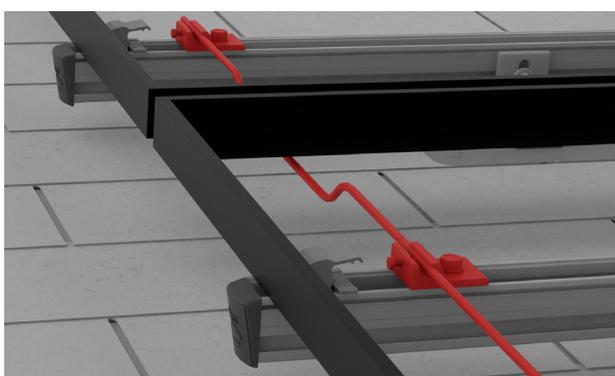

CrossRail 48-X/XL End Cap shown.

Materials required: End Cap

12 SYSTEM GROUNDING

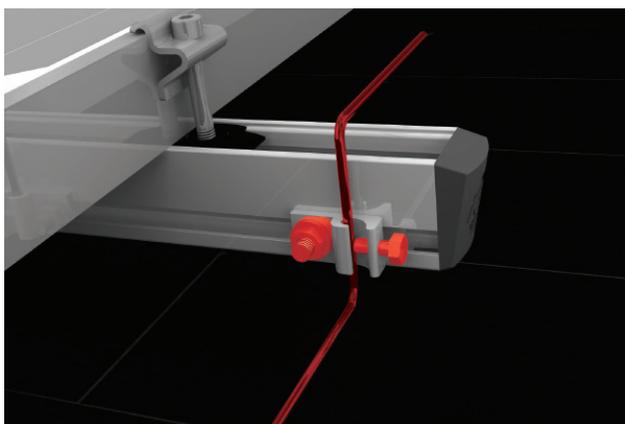

IMPORTANT NOTE

CrossRail components are required to be electrically bonded and grounded via the Everest Ground Lug or Burndy's WEEB Lug 10 and the use of #6 or #8 AWG solid copper wire. A minimum of one lug is required per each independent row of modules.

A OPTION 1

To attach the Everest Ground Lug, insert the MK3 slot nut of the preassembled ground lug into the top channel of the CrossRail. While slightly lifting the plastic tabs, rotate 90 degrees clockwise to engage the MK3 into the channel. Ensure the bonding teeth are perpendicular to the rail channel. Torque the M8 bolt to 10 ft-lbs using a 13 mm socket. Insert a #6 or #8 AWG solid copper wire and tighten terminal screw to 35 - 60 in-lb using a 7/16" socket.

B OPTION 2

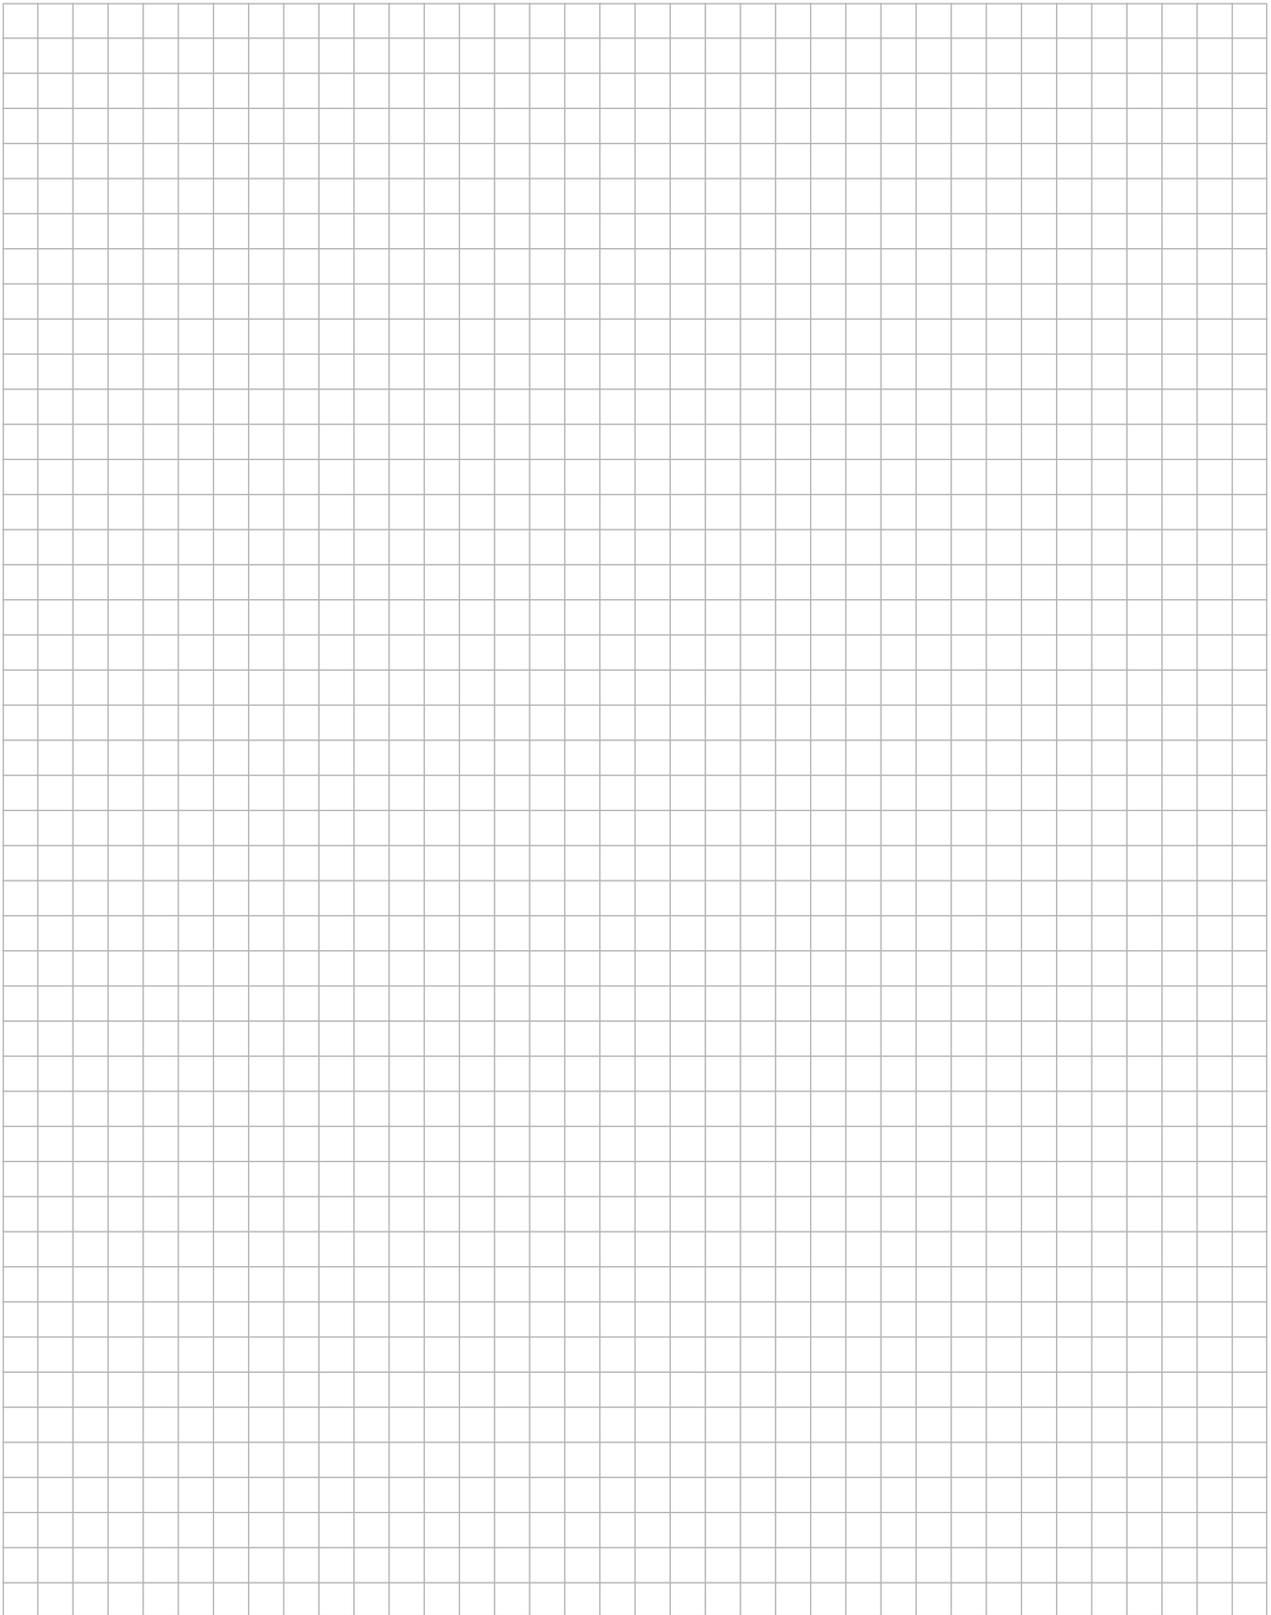

To attach the WEEB Lug 10.3, insert the M10 T-Bolt into the side slot on CrossRail and rotate clockwise 90 degrees. Attach the remaining components, as shown, tightening the Serrated Hex Nut to 15 ft-lb (20.3 Nm). Once the lug has been installed, a #6 or #8 AWG solid copper wire from a DC ground location external to the array must be inserted in the equipment ground conductor location on the lug. Torque the bolt to 5 ft-lb (6.7 Nm).

Note: Verify with your local jurisdiction that the WEEB Lug 10.3 is considered a single-use item in a UL 2703 Listed System.

Warning: Employ best industry practices to ensure that copper does not contact aluminum and galvanized steel.

Note: the WEEB Lug 10.3 utilizes a WEEB 11.5 as a bonding washer and thus carries the markings of a WEEB 11.5
