New Warehouse in Irún:

K2 Systems strengthens its presence in the Iberian market

K2 Systems has opened a new warehouse in Irún to improve the availability of its photovoltaic mounting systems and speed up supply to customers and distributors in Spain and Portugal. The first delivery of material from Germany arrived on 10 August 2026, and the first project supplied from this facility was dispatched on 12 August.

A location that improves supply

Irún offers good connections to the Cantabrian coast, Madrid, Lisbon and Porto, and benefits from an established network of logistics infrastructure and international transport. From the new warehouse, K2 Systems will be able to deliver to numerous destinations across the Iberian Peninsula within 24 to 48 hours, depending on the destination and the order.

"Choosing Irún reflects our need to bring our stock closer to customers and improve our responsiveness in Spain and Portugal," say Eugenio Segarra, Country Manager of K2 Systems Spain, and Antonio Vela, Country Manager of K2 Systems Portugal.

Mounting systems for photovoltaic projects

The new warehouse will hold a base stock of mounting systems and components for roof, façade, ground-mount and carport applications, for residential and industrial projects. It will also facilitate stock orders for distributors and allow K2 Systems to respond to specific product needs or stock shortages.

Order management will continue to be handled internally by K2 Systems, which will select the most efficient supply option for each request.

Locating stock closer to the markets will also shorten transport distances and reduce unnecessary journeys. The company expects that, in certain cases, delivery times could be cut by more than half.

"With the new warehouse, we are expanding our supply capacity on the Iberian Peninsula and building a foundation to keep serving distributors, EPCs and installers in Spain and Portugal," note Eugenio Segarra and Antonio Vela.

The facility is operated by a logistics partner specialized in the Iberian Peninsula, under the supervision of K2 Systems.

Connecting Strength

portfolio also includes mounting systems for façades, ground mounts and carports. Digital services, such as the K2 Base planning software, support the process, making PV projects quicker and easier.

K2 Systems develops in Germany, manufactures predominantly in Europe, and focuses on a sustainable sourcing strategy. PV systems with K2 substructures are in use in over 130 countries and generate approximately 126 GWh per day. The heart of its strategy is the development of easy-to-install mounting systems that are precisely tailored to the needs of customers. With around 420 employees at nine global locations and in close cooperation with international partners, the company is working towards the vision of global electricity generation from solar energy. This is how K2 Systems is driving the energy transition.
